- From the Chrysler LH QFD matrix, one can determine that development team had a strong emphasis on powertrain and chassis performance, in the areas of responsiveness and road manners. The program also highly valued safety, reliability and exterior appearance. Chrysler succeeded in satisfying these stakeholder requirements, and over 20 years later goes back to this program as the benchmark for powertrain and chassis layout of a FWD luxury platform.
 - During my time at Chrysler designing front wheel drive chassis and suspension layouts, the engineers who had been there long enough to live the LH program would gripe about how far Chrysler (and parent Fiat) had strayed from the high performing LH, longitudinal front wheel drive layout.
- However, the customer requirement for safety may have not been fully developed. Nowhere on the QFD does Chrysler mention headlight performance, a critical measure for night driving safety. As a result, the headlight performance fell short, so short in fact that they were forced to redesign the headlights after just one model year. Their solution was to bring state-of-the-art projector beam technology to distinguish this new headlight's performance from the failure at launch. Had they captured headlight performance in their QFD and tied it to the highly rated importance that safety carried, this expensive redesign and bad press could have been avoided.

A brief overview of the Chrysler LH program success and failures tied to the QFD course material.
